This stereoscopic atlas is based on the slide collection of the late Professor B. Daicker, Basel, who was renowned for his merits in ophthalmopathology the world over. From the compilation of on the whole 12,000 stereoscopic slides of interesting and rare eye diseases, the editor selected 216 pairs to make them available to interested health professionals. These images can be viewed through stereo glasses (provided with the atlas) to obtain a stereoscopic depth perception. The atlas is divided into seven chapters. Each chapter starts with a short introduction, followed by the slides, which are complemented by a description of the disease and by additional images which can be found on the also included CD-ROM. The technical efforts made together with the carefully selected content make this atlas unique and indispensable. The stereoscopic visualization enhances the comprehension of eye disorders and makes it a much-welcomed tool for the differential diagnostic process.

Today, ophthalmic pathology deals more and more with pathogenesis using highly sophisticated techniques. In recent decades, it has expanded to such an extent that it now fills several volumes of a modern comprehensive atlas or textbook. Black and white prints of the macroscopic appearance of dissected eyes are standard in modern textbooks. Color photographs, although providing more visual information and a better insight into the sometimes complex disease processes of the eye, are however costly. Nevertheless, many ophthalmologic colleagues expressed their desire to have me prepare such an atlas. It is not intended to replace one of the textbooks in this field but rather to supplement existing texts and to stimulate clinical and diagnostic thinking. Hence it should be used in conjunction with textbooks on anatomy and ocular pathology. The reader will find references on the different subjects in the excellent modern textbooks listed below. Diagnosis and treatment in ophthalmology is to a great extent based on morphologic examination. Clinical ophthalmologists have available such excellent tools as the slit-lamp, the gonioscope, and the ophthalmoscope to study and document ocular disease in vivo under high magnification. Both external eye structures and transparent ocular structures can be observed better in vivo than in the pathology laboratory. Therefore the pathology of these is only presented in conditions in which direct visualization is normally difficult.

It is indeed a pleasure to write a foreword for this spectacular book which represents a landmark in the history of ocular pathology. Not since the three volumes of the Henke-Lubarsch handbook appeared forty years ago has anything like this come on the market. This book represents a comprehensive, thorough and up-to-date clinically oriented textbook on ocular pathology. We are all indebted to the senior author, who is now professor of ophthalmology at the University of Erlangen, who presents us here with the fruit of decades of industrious endeavors. We also have to be grateful to the American ophthalmic pathologist, Dr. David Apple, who, as one of the main collaborators of the German edition, has now provided us with the English translation. The book has a twofold purpose: First, it is meant to be a source of instruction for ophthalmologists and pathologists. For that purpose it is beautifully illustrated both by clinical pictures and by excellent photomicrographs and electromicroscopic pictures. Most valuable from a didactic point of view are the colored schematic drawings and the many tables. These two features are practically unique and should help any neophyte in grasping the principles of ocular pathology.
